Undefined & Defined Terms — Notes — Answer Key

Watch the video. The underlined words in the video are the ones you fill in here.

Name: _____ Date: _____

☞ *Video: Three words we never define*

Key Idea

Every word in geometry is built from three **undefined** terms.

Point A: a location with **no size**. Like the **pin** on a map.

Line AB: **straight**, goes on **forever** both ways.

Plane P: a **flat** surface that goes on forever, like a floor that never ends.

☞ *Video: Defined terms — and their symbols*

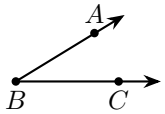

Key Idea

Term	Picture	Symbol	What the symbol tells you
Line		$\overleftrightarrow{AB}$	**two** arrows: goes on forever **both ways**
Ray		$\overrightarrow{AB}$	starts at A — the endpoint is written **first**
Segment		$\overline{AB}$	**two** endpoints — it can be **measured**

☞ *Video: Length and angle*

Key Idea

Length: AB with **no bar** is a **number**, the length of $\overline{AB}$ (like 5 cm).

Angle: written $\angle ABC$. The **vertex** B always goes in the **middle**.

☞ *Video: The mistake almost everyone makes*

Common Mistake

$\overrightarrow{AB}$ and $\overrightarrow{BA}$ are **different** rays — they start at different points.
But $\overline{AB}$ and $\overline{BA}$ are the **same** segment.

☞ *Video: Collinear, coplanar, intersection*

Key Idea

Collinear points on the same **line**

Coplanar points on the same **plane**

Two lines intersect in a **point**

Two planes intersect in a **line**

☞ *Video: Your turn*

Your Turn

Name this figure with the right symbol: $\overrightarrow{PQ}$

It is a **ray**; the endpoint P comes first.
